

# GOES-R Aviation and Lightning Risk Reduction Initiatives

Wayne F. Feltz<sup>1</sup> and Larry Carey<sup>2</sup>

<sup>1</sup>*Cooperative Institute for Meteorological Satellite Studies (CIMSS),  
University of Wisconsin – Madison, U. S. A.*

<sup>2</sup>*Earth System Science Center (ESSC),  
University of Alabama-Huntsville, U. S. A.*

# GOES-R Aviation Team

AWG Aviation Team Chairs : Ken Pryor, Wayne Feltz

## ➤ Convective Initiation

- John Mecikalski (Lead)
- Wayne MacKenzie
- Kris Bedka/Wayne Feltz

## ➤ Enhanced-V/Overshooting top detection

- Kristopher Bedka (Lead)
- Jason Brunner
- Wayne Feltz

## ➤ Turbulence

- Anthony Wimmers (Lead)
- Wayne Feltz

## ➤ Volcanic ash

- Mike Pavolonis (Lead)
- Justin Sieglaff (Support)

## ➤ SO<sub>2</sub>

- Mike Pavolonis (Lead)
- Andrew Parker (Support)

## ➤ Fog/Low Cloud

- Mike Pavolonis (Lead)
- Corey Calvert (Support)

## ➤ Aircraft Icing

- Bill Smith, Jr. (Lead)
- Stephanie Houser (Support)

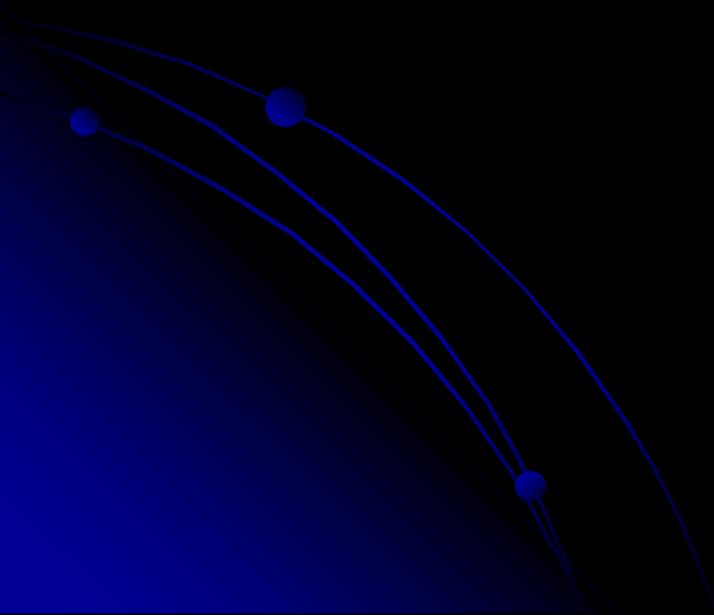

## ➤ Visibility

- Brad Pierce (Lead)
- Wayne Feltz

# Goals

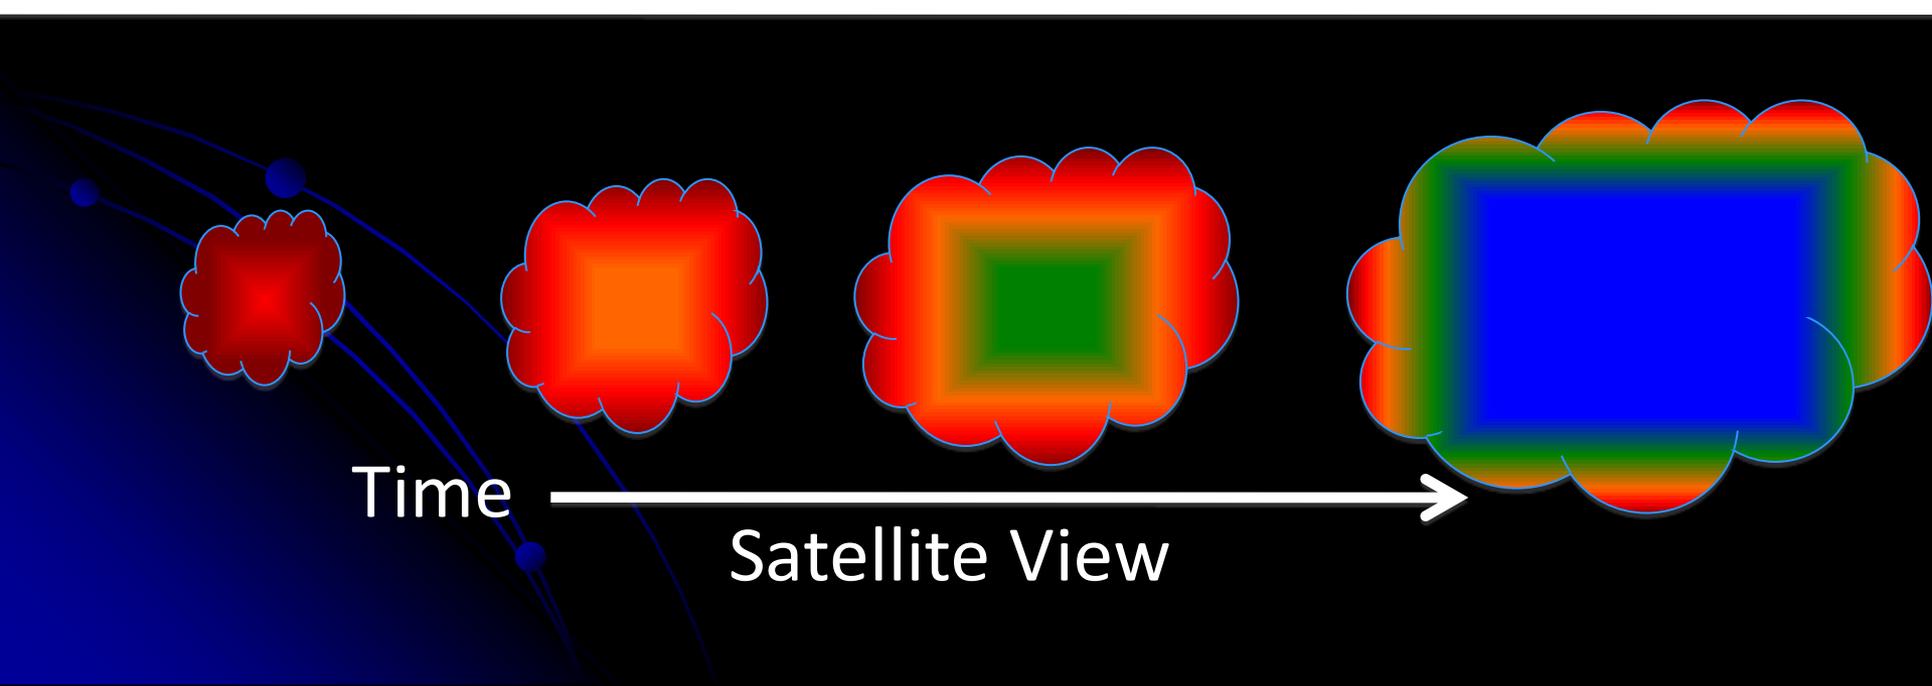

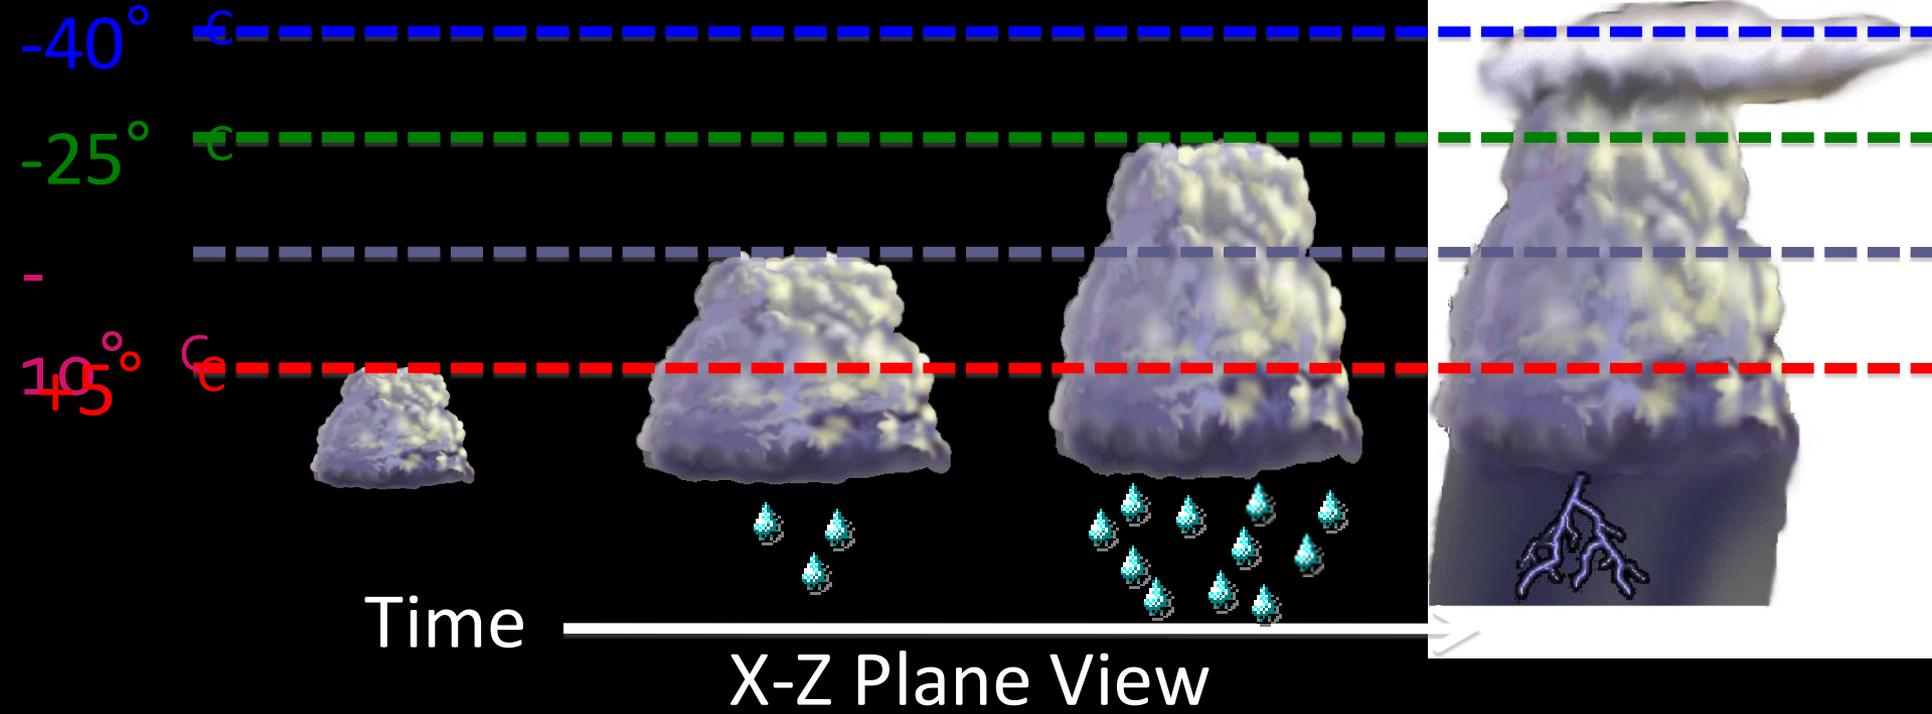

- GOES-R Aviation Requirements
  - Lightning relationships
  - Areas of synergy
- Convective Initiation
- Overshooting-top
- Turbulence
- Collaboration opportunities between AWG/R3 teams and applications

# Convective Initiation

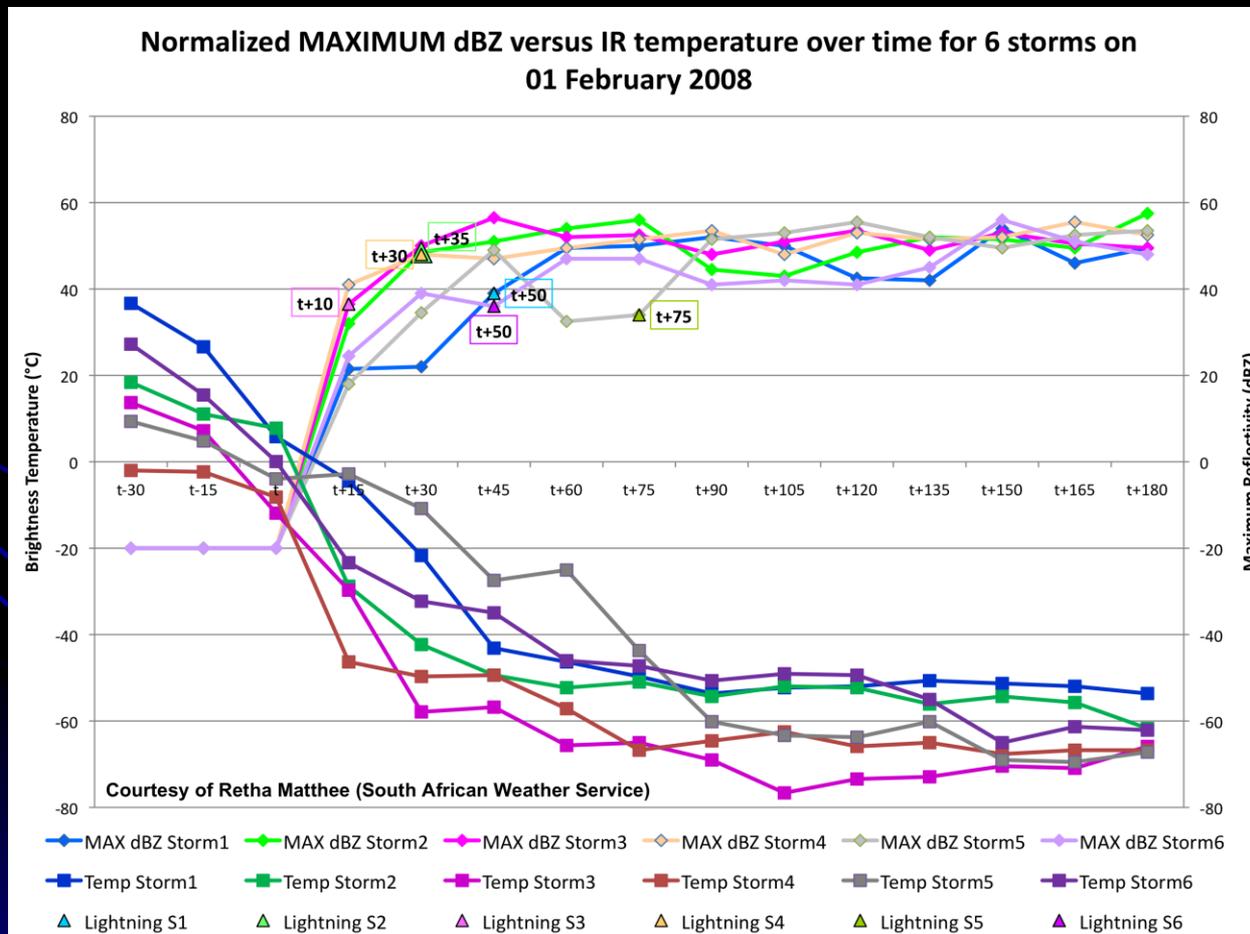

# CI Definition

Roberts and Rutledge (2003) and Mecikalski and Bedka (2006) define Convective Initiation as the “first occurrence of a 35 dBZ radar reflectivity .”

# Satellite Observations of Convective Initiation

- Rapid IR window cloud-top cooling can precede significant rainfall (> 35 dBZ) by ~30-60 mins, imager-based (not sounder)
- Roberts and Rutledge 2003 (WAF)
- The first cloud-top ground strikes were most often observed at IR window BTs of  $\sim -40^{\circ}$  C in a study over S. Africa

# CDR Algorithm

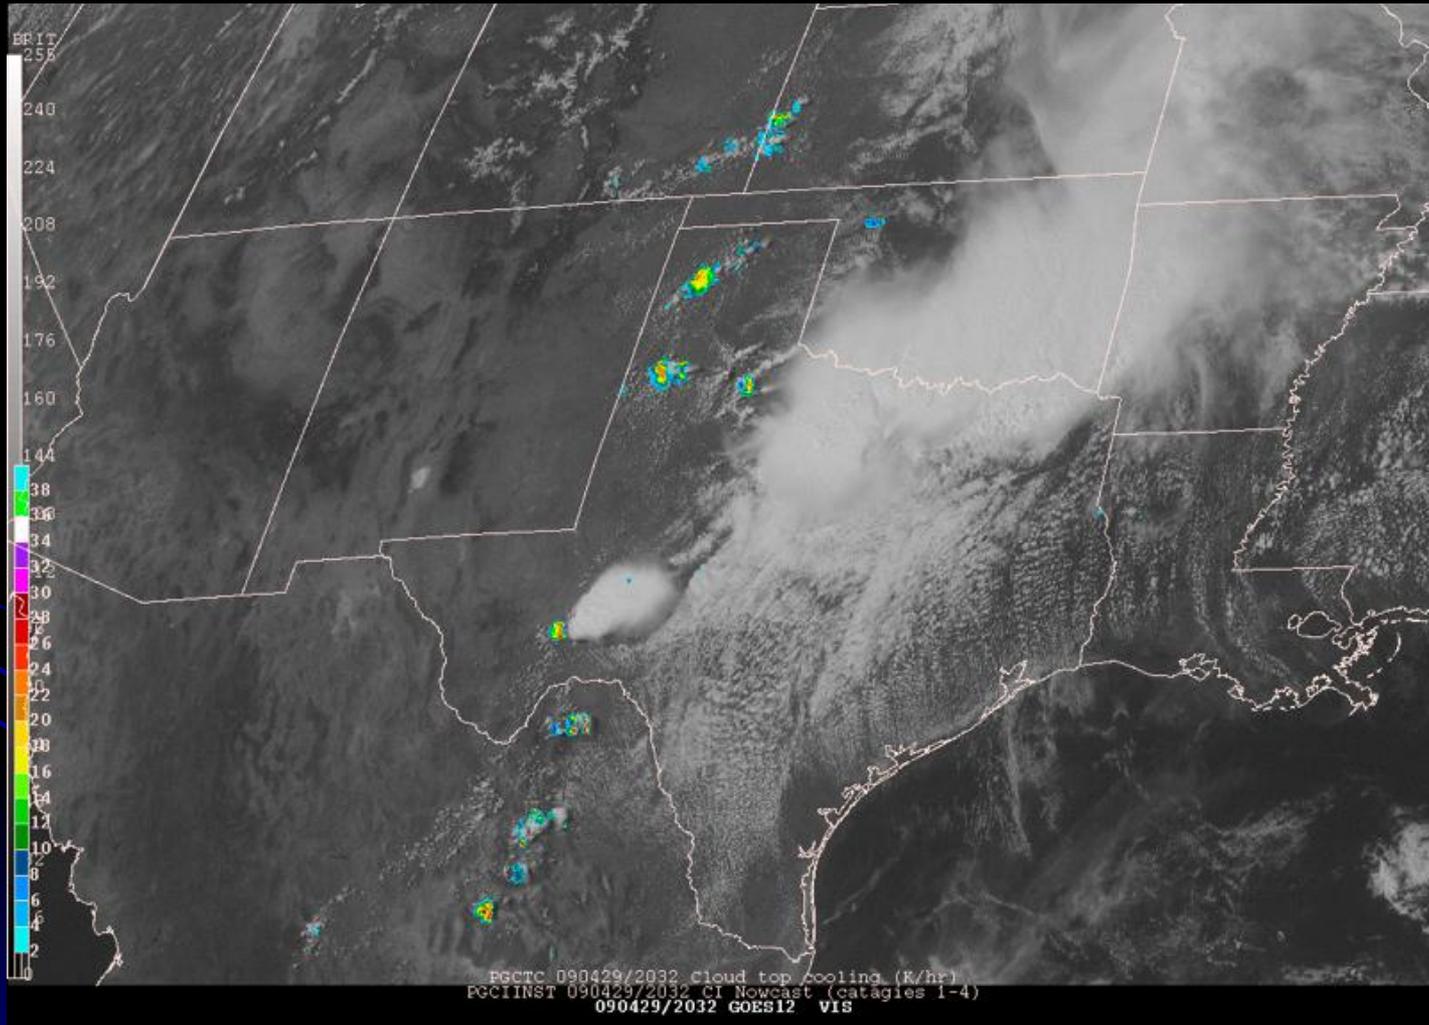

- **At CDR, there were two basic solutions under consideration**
  - **Object based Multi-spectral thresholding technique (Mecikalski and Bedka 2006)**
  - **Box-average/cloud top cooling**

# UWCI Algorithm Description

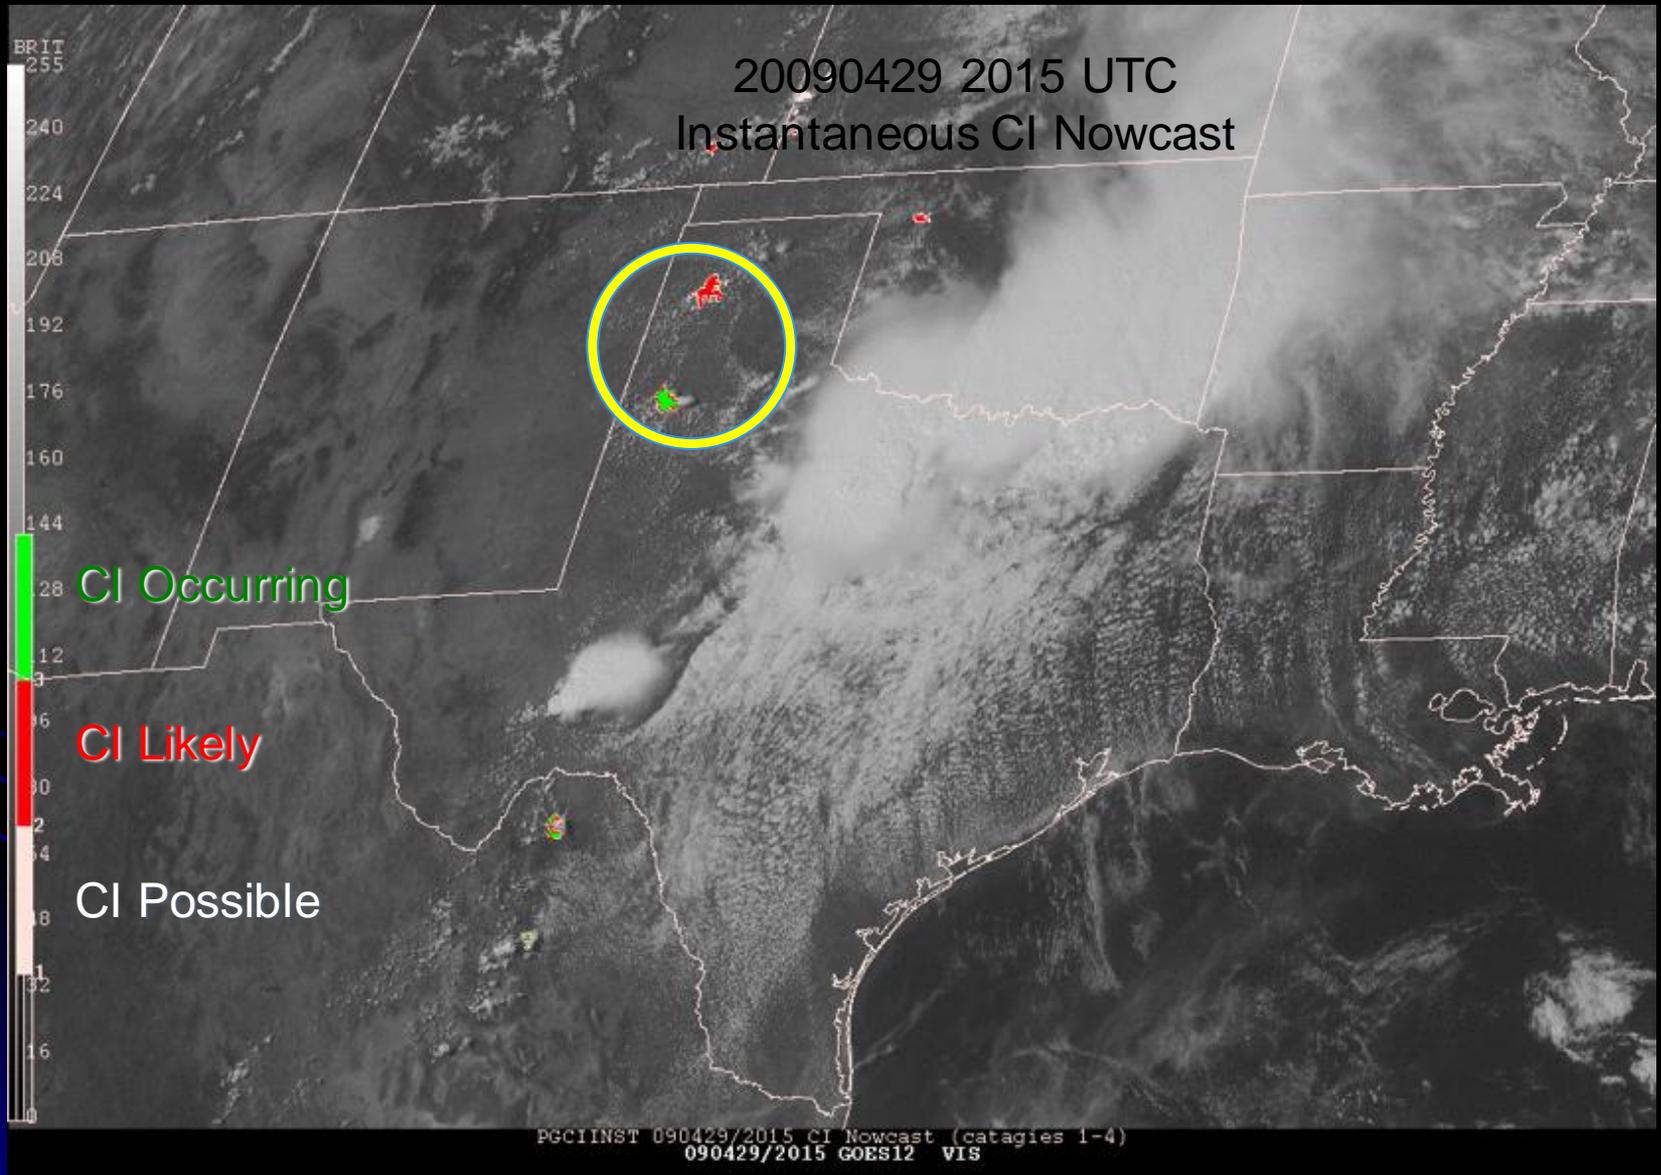

- Day/Night UW Cloud typing product (Pavolonis et al, uses 3.9, 6.7, 10.7, and 12.0/13.3 um channels)
- Monitor microphysical properties
- Infrared window (10.7 um) box-averaging conducted (monitoring mean 10.7 um cooling rate over area)
- This algorithm for convective initiation phase only
- Two primary algorithm products are cloud top cooling (CTC) rate and CI nowcast
- [http://cimss.ssec.wisc.edu/goes\\_r/proving-ground/GOES\\_CINowcast.html](http://cimss.ssec.wisc.edu/goes_r/proving-ground/GOES_CINowcast.html)

# 20090429 Dryline CI Case

# AWIPS CI/CTC Interaction with Sullivan (MKE) NWS Office

Forecaster generated screen captures from AWIPS at MKE

# AWIPS CI/CTC Interaction with Sullivan (MKE) NWS Office

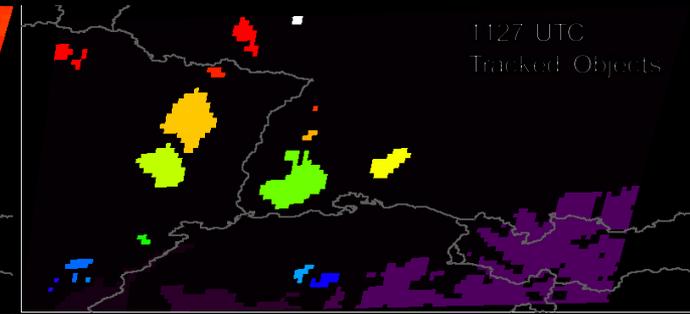

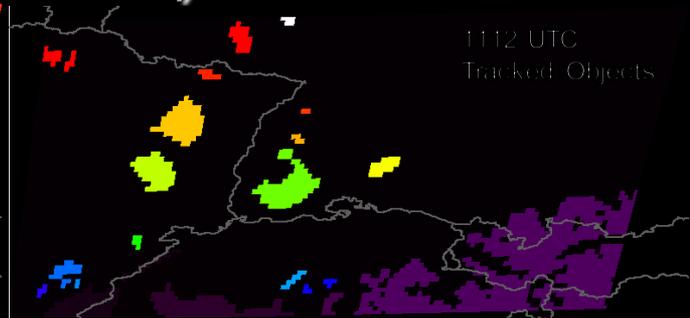

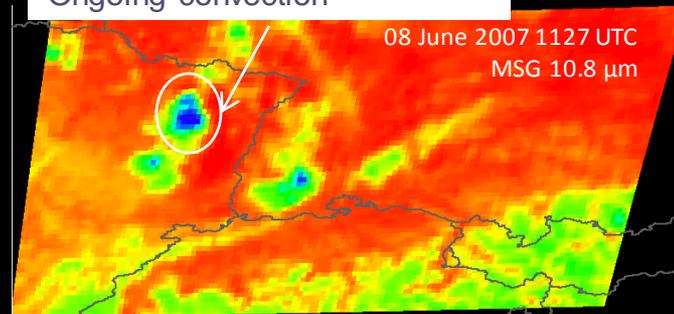

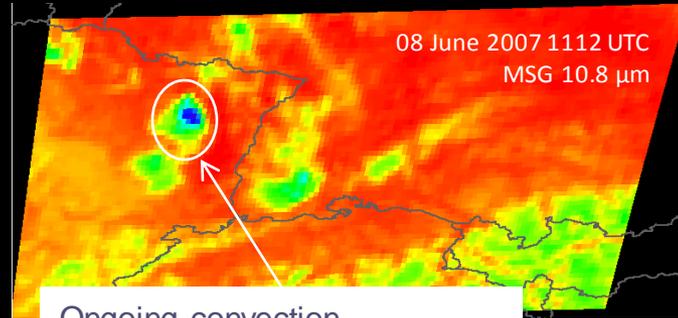

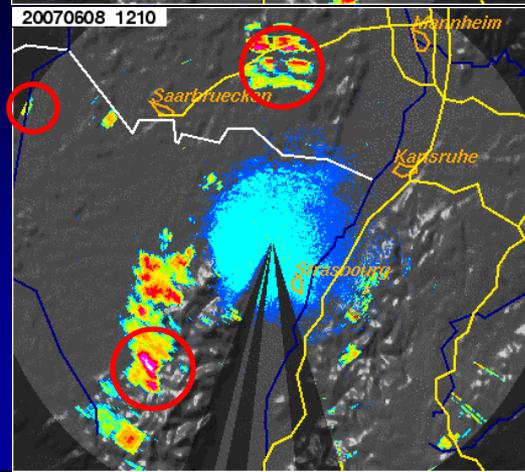

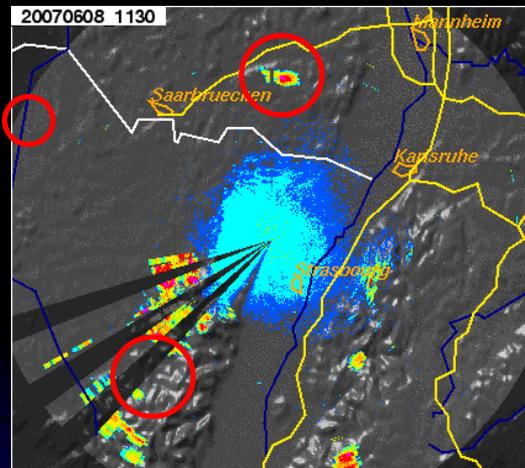

*"The UWCI performed very well in Iowa last night! These thunderstorms fired up along an existing boundary and are coincident with the leading edge of 700mb moisture transport and weak 850mb warm air advection."*

*- Marcia Cronce NWS Forecaster*

# Algorithm Example

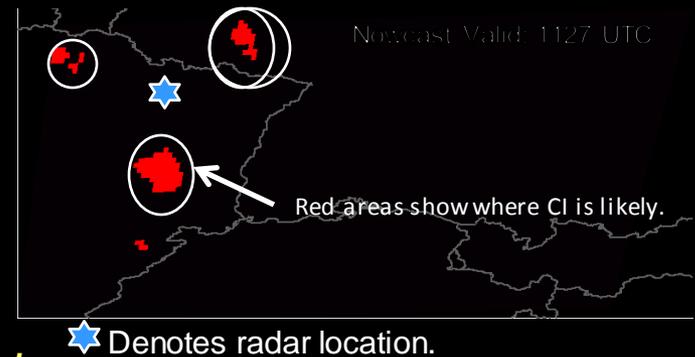

## UAH Overlap Object Tracking

### (SPC HWT Candidate 2010)

Circled areas show the nowcasted regions, and their locations on the radar. There was ongoing convection, and the CI algorithm picked up on regions where CI was going to occur with ~40 minute lead time.

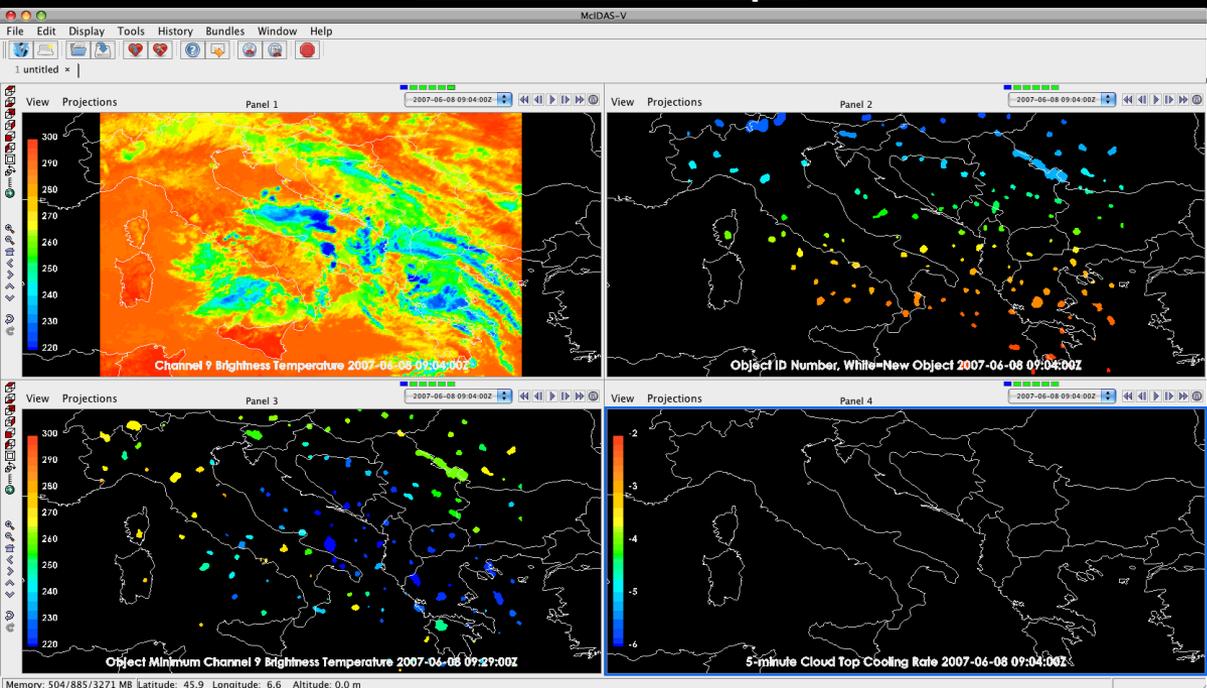

**GOES-R Lightning AWG/R3 Review**

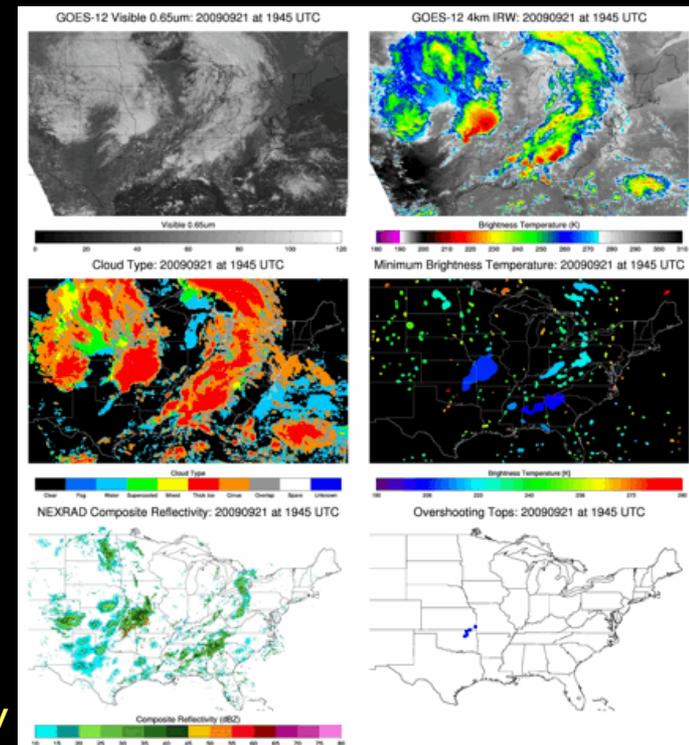

# Exploring the Use of Object Tracking for CI Nowcasting

- UW-CIMSS and the University of Alabama in Huntsville (UAH) are working toward development of object-based methods for CI nowcasting in the GOES-R ABI era, using current GOES-12 and MSG SEVIRI as proxies for GOES-R
- UW-CIMSS is experimenting with the Warning Decision Support System-Integrated Information (WDSS-II, Lakshmanan et al. (*J. Tech.*, 2009), (*WAF*, 2007)) to compute cloud-top cooling rates, which can be used with cloud-top microphysical trends to produce CI nowcasts
- Radar reflectivity can be remapped to the satellite resolution/projection and carried along with the satellite-derived objects for reliable product validation. (funded with GOES GIMPAP 2010-2011)
  - This capability is not available with current pixel-based CI nowcast methods which causes significant difficulty in evaluating current product accuracy over large scenes and numerous cases

**GOES-R Lightning AWG/R3 Review**

# Identification of Significant Turbulence Events

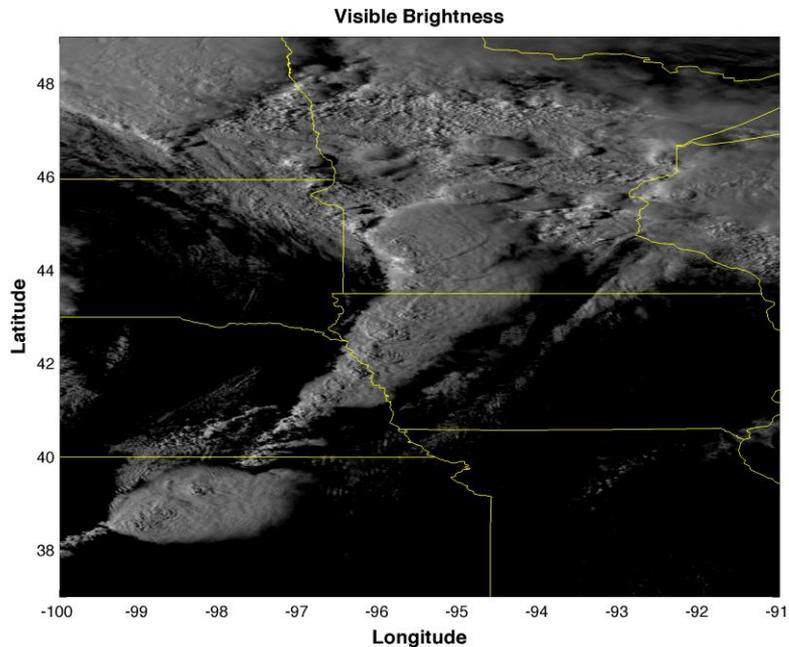

Null: Peak EDR=.05

Light: Peak EDR=.15

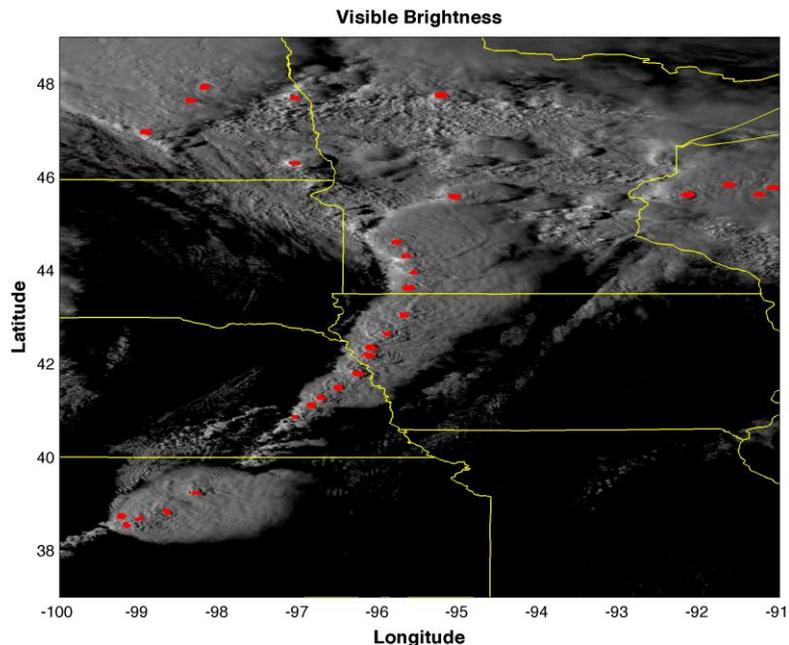

Moderate: Peak EDR .25-.45

Severe: Peak EDR  $\geq$  .55

- EDR observations are grouped from 1200-1159 UTC during winter (Nov-Mar) and convective (Apr-Oct) season days to identify significant turbulence events
  - Significant event=Event having a # of MOD and SVR observations exceeding 2 std. dev. from the seasonal mean
- We collect and analyze all available GOES, MODIS, and AVHRR imagery around times with a high concentration of MOD to SVR reports

**AVHRR 2 km (or GOES-R ABI)**

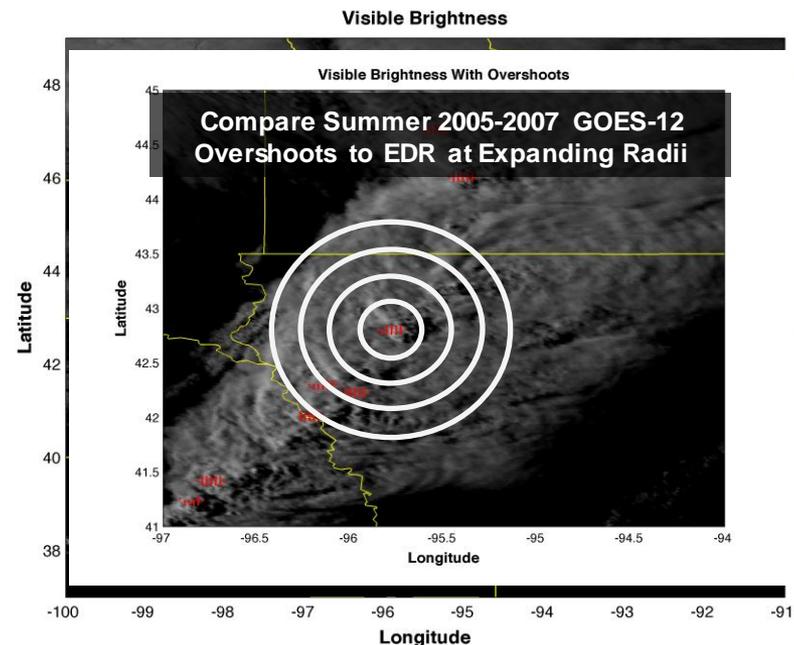

## **Objective Day/Night Overshooting Top Detection Using Current and Future GOES**

IR window imagery is used to identify overshooting tops occurring during both day and night  
 A study of 450 enhanced-V producing overshooting top cases (Brunner et al. (WAF, 2007)) shows that tops are:

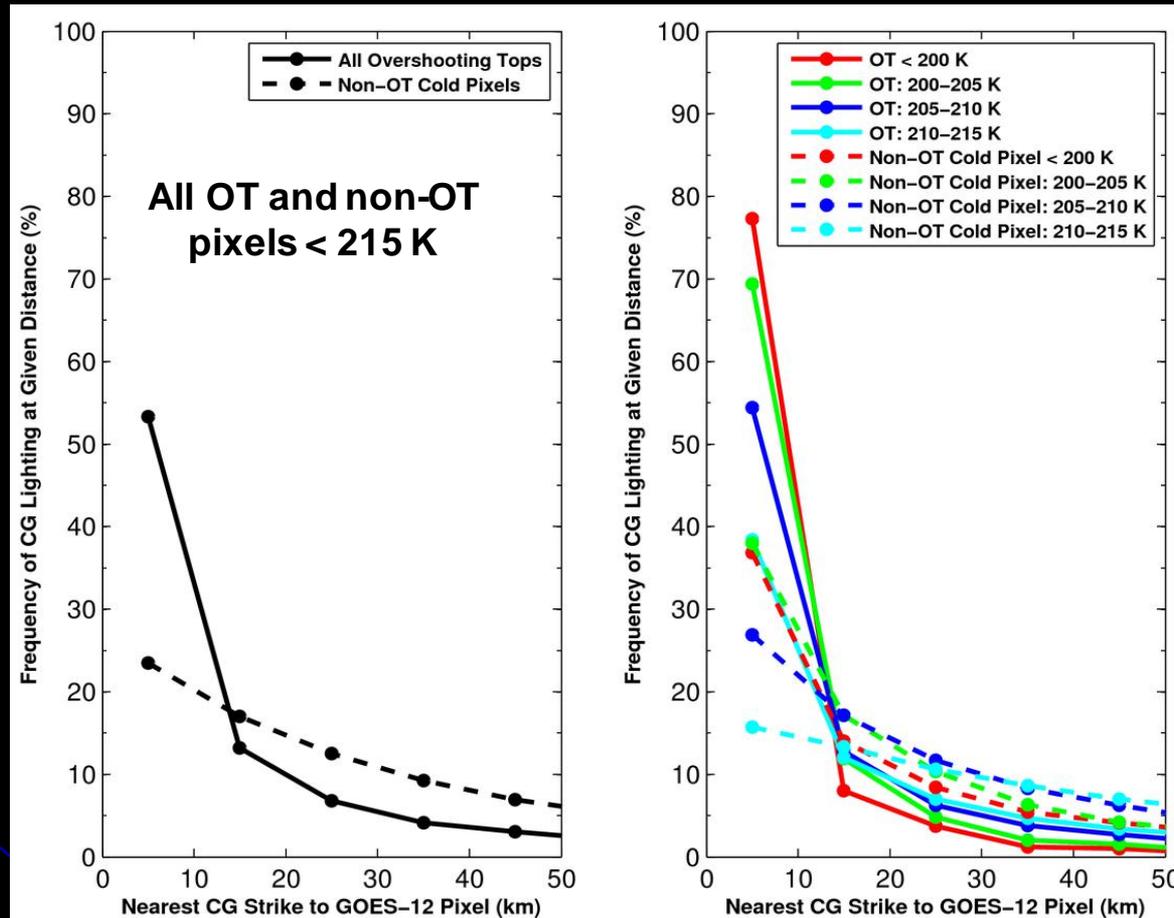

- 1) isolated clusters of pixels (< 12 km<sup>2</sup> area) colder than 215 K and the GFS tropopause temp
- 2) significantly colder (> 6.5 K) than the surrounding anvil cloud

**Higher ABI spatial resolution leads to better observation of cold BT minima and improved overshooting detection**  
**4 km GOES-12**

ing A

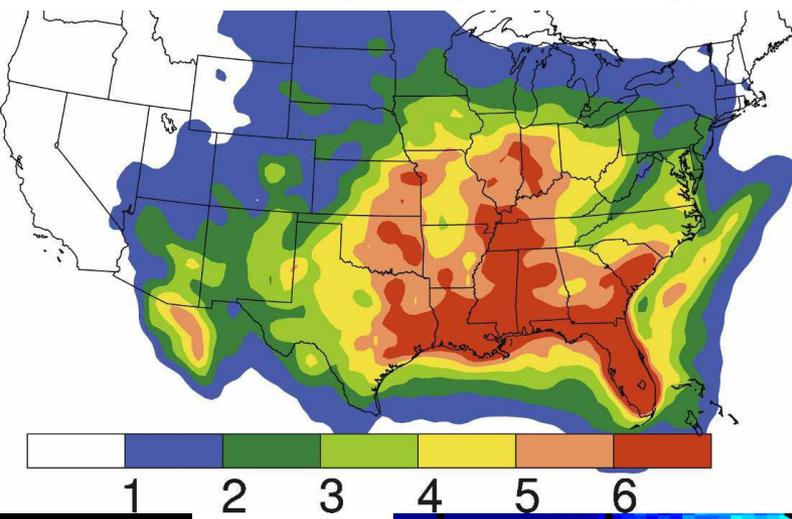

# GOES-12 Overshooting Top Relationships with Cloud-to-Ground Lightning

CG lightning is 30% more likely to be found very near (0-10 km) to GOES-12 OT's than non-overshooting cold pixels

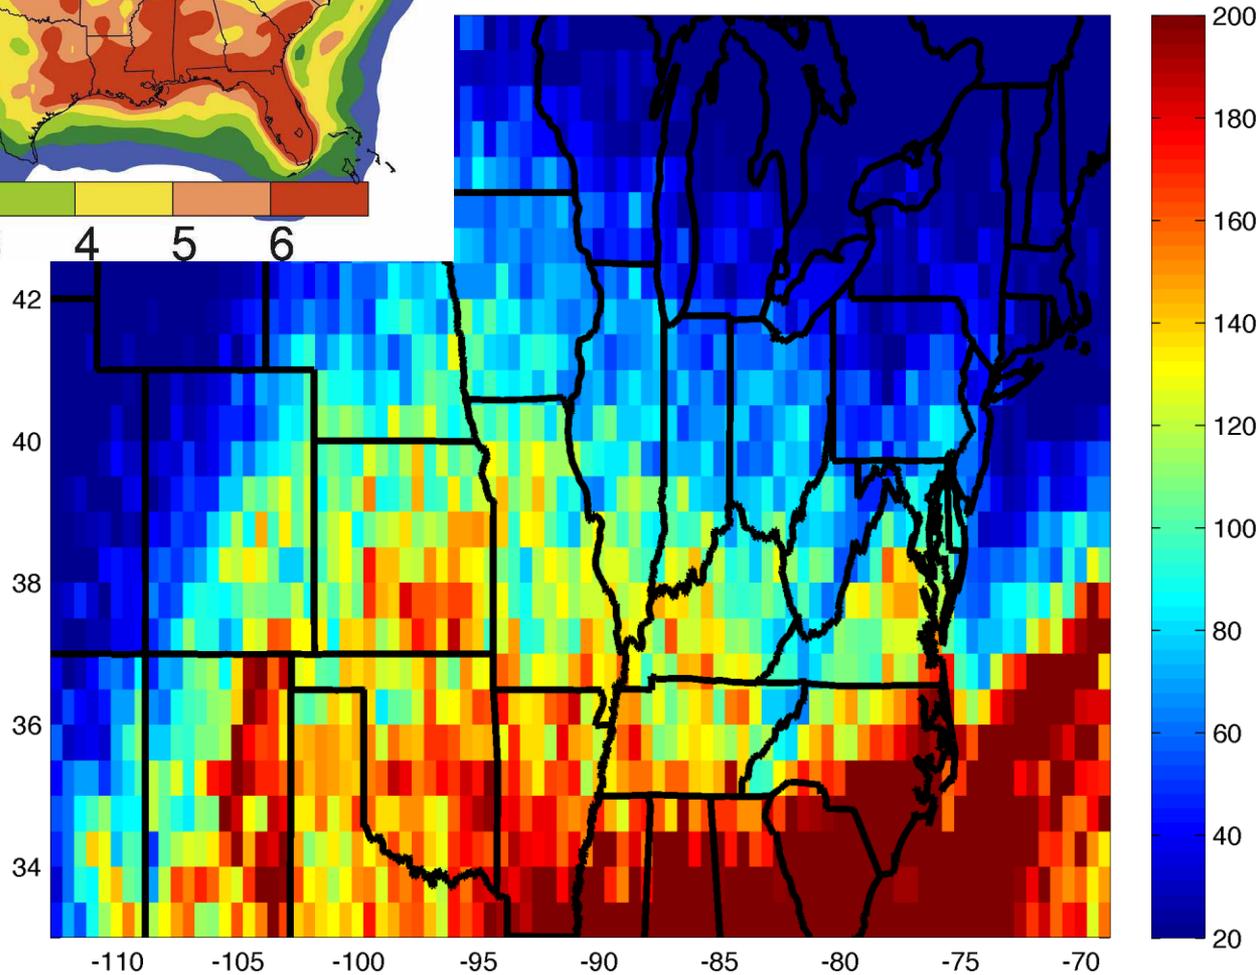

OTs with very cold BTs represent a significant lightning hazard (Bedka et al, 2009)

# 5-Year CG Lightning Climatology

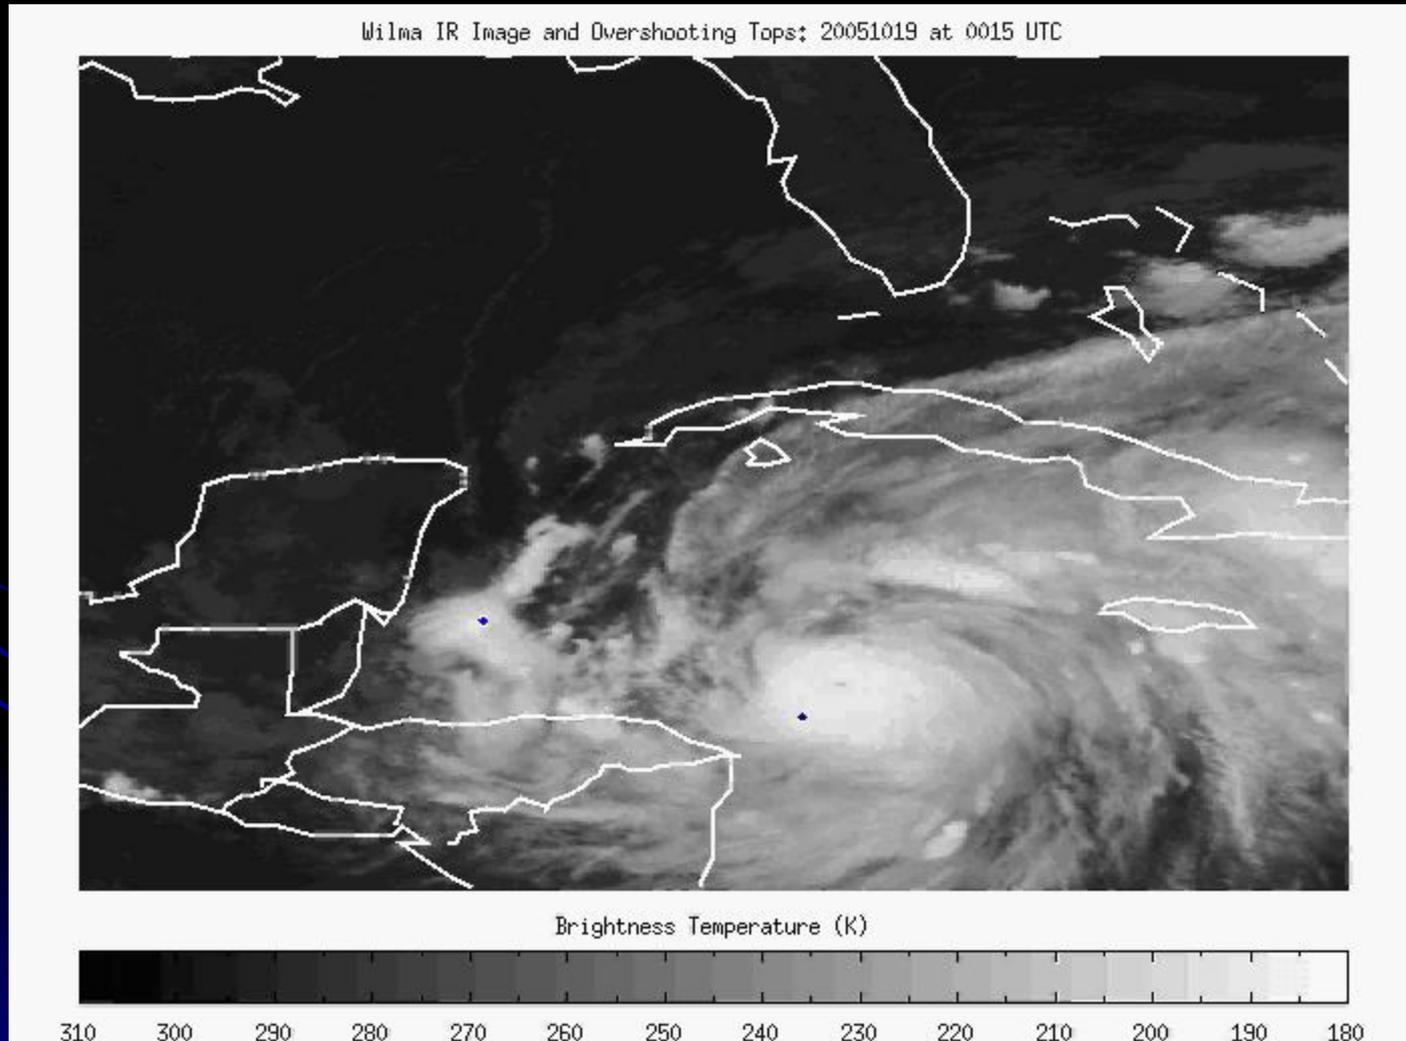

# Overshooting Top Climatology: Summers 2004-2008

# OT Frequency for Climate Phase Signal (ENSO)

GOES-10/11 OT Frequency 2006

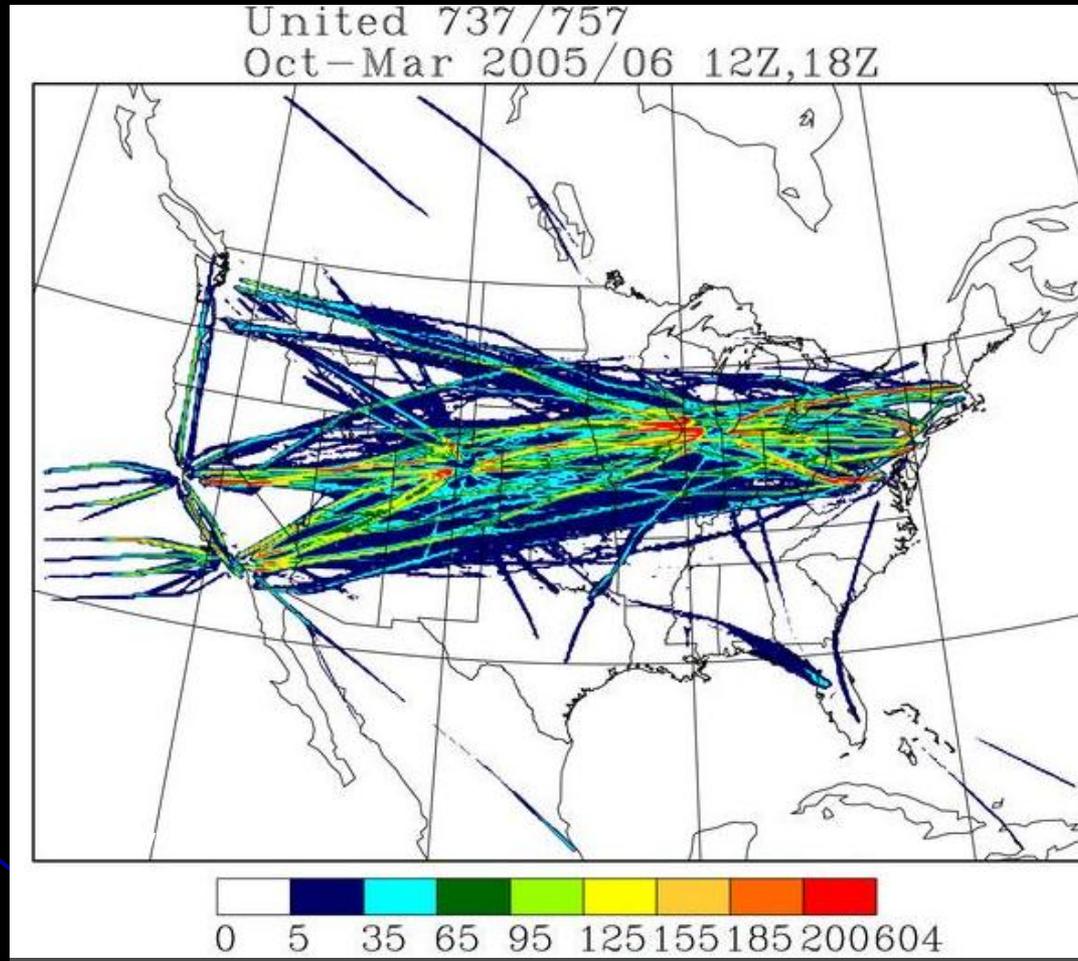

GOES-10/11 OT Frequency 2007

# Convectively Induced Turbulence

# EDR Turbulence Observations

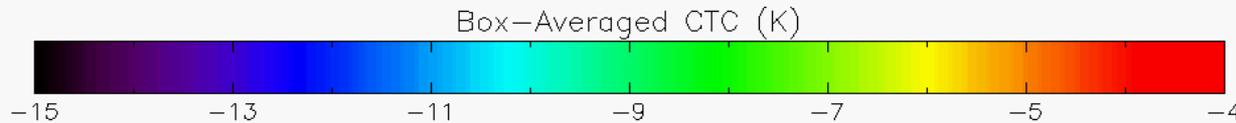

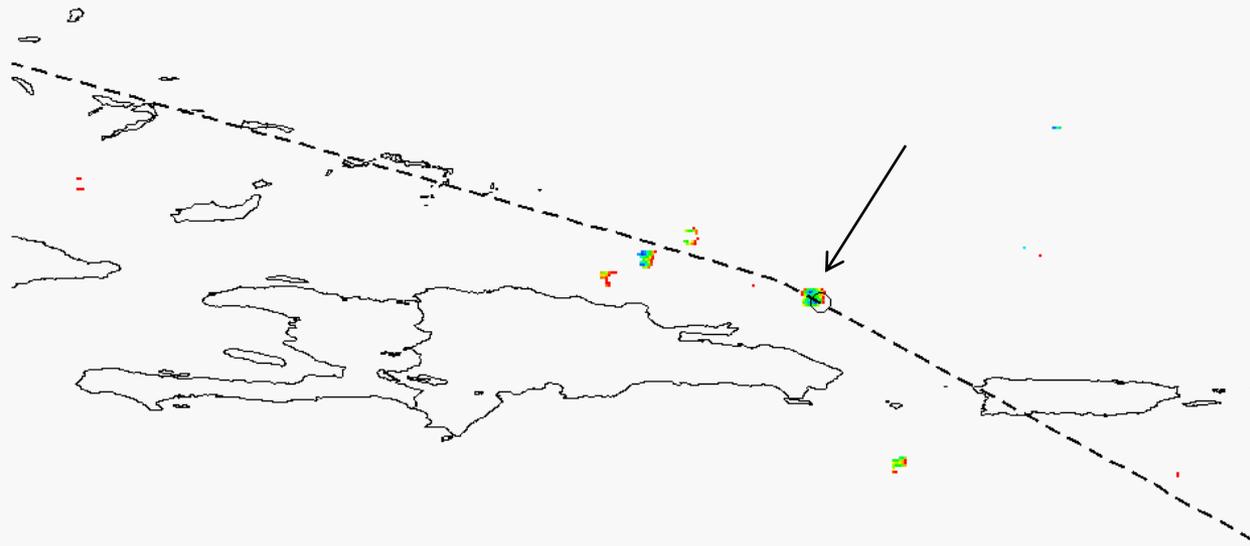

- Many United Airlines Boeing 757 aircraft are collecting Eddy Dissipation Rate (EDR) observations, an objective measure of aircraft turbulence (Cornman et al., *J. Aircraft*, 1995)
- *Delta and Southwest Airlines EDR observations will be collected in 2009*
- EDR provides a significant advantage over PIREPS in their: 1) objectivity, 2) positional accuracy, and 3) frequency of turbulent + null reporting (every minute)
