GOES-17 Saturation Prediction Reference Tools for 2022

Joseph Fiore, Matt Seybold, and Seth Iacangelo
Outline of Saturation Prediction Reference Tools

- Caveats & Assumptions
- Daily Maximum Temperatures
- Daily Maximum Temperatures with Band Thresholds
- Hour-by-Hour Band Saturation
- Interpretation of Marginal and Unusable Hours
- Example Images of “Marginal” and “Unusable” Hours
- Details on Cooling Timeline
**Important Caveat**

- **NOTE:** All of the information in this slide deck is **predictive**
- The actual extent of saturation will differ from the predictions by both temperature magnitude and time of day
- Differences between actual and prediction may also have seasonal variations
- The data in this slide deck indicate “marginal” saturation when imagery is still useful, but some saturation artifacts are present (see example images toward the end of slide deck)
- In coming months, the predicted data will be revisited and in cases where the predictions may be improved, this slide deck will be updated and redistributed
- There is an additional planned mitigation that is not reflected in the predicted temperatures: During the four warm periods, the FPM set point will be changed to 87K which is expected to provide 2-3K cooling
Assumptions

• Inclusions reflect current (February 1, 2022) operational status
  – Thermal model uses Mode 6 with GOES-West mesoscale domain sector (MDS) default locations over Alaska and California
  – Semi-annual yaw flip to reduce solar load (~3 weeks after and before each equinox ~ April 6, 2022, and September 7, 2022)
  – Predictive Calibration is included in setting the “marginal” and “unusable” per-band imagery thresholds
  – Mode 3 Cooling Timeline: 15-minute Full Disk, 2 MDS Domains each at 2-minute refresh
    • See slides 17-21 for explanation of cooling timeline
This plot shows daily maximum temperature of the ABI focal plane module. These maximums occur at night. The higher the temperature, the more saturated imagery becomes.
This plot shows daily maximum temperature of the ABI focal plane module. These maximums occur at night. The higher the temperature, the more saturated imagery becomes. Where the temperature rises to approach a black line for each band, marginal saturation may be observed in imagery. Where the temperature curve exceeds a black line for each band, the imagery may begin to saturate so much that it becomes unusable. The plot also shows the cooling timelines (purple line), and yaw flips (red circles) for 2022.
This plot shows hourly maximum temperature of the ABI focal plane module. The higher the temperature, the more saturated imagery becomes. Where the temperature rises to approach a black line for each band, marginal saturation may be observed in imagery. Where the temperature curve exceeds a black line for each band, the imagery may begin to saturate so much that it becomes unusable. The hour of peak temperature varies from day to day.

Planned 87K FPM setpoint is expected to provide 2-3K additional cooling for the warmest days.

Where the temperature curve exceeds a black line for each band, the imagery may begin to saturate so much that it becomes unusable. The hour of peak temperature varies from day to day.

Planned 87K FPM setpoint is expected to provide 2-3K additional cooling for the warmest days.

The time of day for the peak of each curve varies from day to day. The large shift in the peak of several days is shifted as the result of a yaw flip.

Example of Marginally Saturated Image
Example of Unusable Saturated Image
Introduction to Cooling Timeline

- **Objective:** Lower focal plane temperatures and decrease hours of degraded and saturated imagery

- **Approach:** Alter ABI timeline to spend additional time looking at cool space-looks (vs. comparably hot Earth-looks)

- **Timeline runs from 0600 UTC to 1200 UTC on days when cooling timeline is active**

- **Past Activations**
  - Feb 4, 2021 – Mar 4, 2021
  - April 2, 2021 – May 3, 2021
  - Aug 3, 2021 – Sep 3, 2021
  - Oct 9, 2021- Nov 5, 2021

- **Upcoming Activations**
  - Feb 3, 2022 – Feb 27, 2022
  - ~April 3, 2022 – May 3, 2022
  - ~Aug 5, 2022 – Sep 3, 2022
  - ~Oct 14, 2022- Nov 5, 2022
• Classified as Mode 3:
  – 15 min Full Disk
  – No CONUS
  – Alternating MESO 1/minute

• Compare to Nominal Mode 6:
  – 10 min Full Disk
  – 5 min CONUS
  – MESO 2x1 min / 1x30 sec

Modified from https://www.ospo.noaa.gov/Operations/GOES/west/Mode3G_Cooling_Timeline_G17.html
Over the same time period, Mode 3, replaces three nominal Mode 6 Timelines with two Cooling Timelines:

- Full Disk: 6 to 4
- CONUS: 6 to 0
- MESO: 60 to 30

Modified from [https://www.ospo.noaa.gov/Operations/GOES/west/Mode3G_Cooling_Timeline_G17.html](https://www.ospo.noaa.gov/Operations/GOES/west/Mode3G_Cooling_Timeline_G17.html)
# Observed Cooling Timeline Benefit
